

MANAGED SERVER REPLICATION & RECOVERY

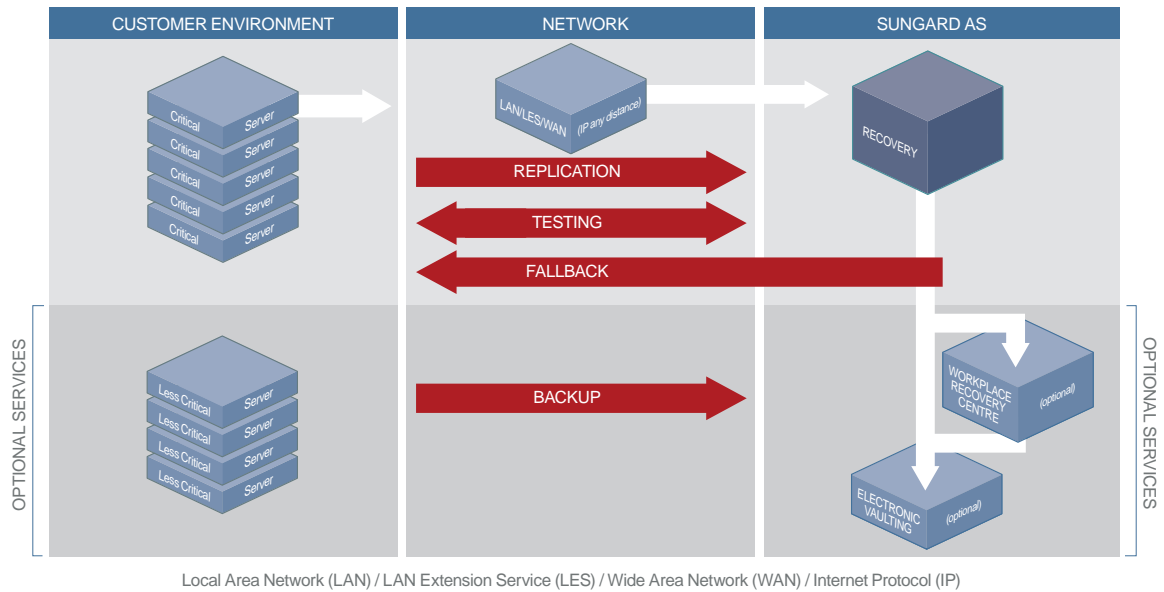

Rapid recovery of your critical servers

Sungard Availability Services' Managed Server Replication & Recovery is a managed service that protects your data, keeps critical servers running and ensures rapid recovery of failed systems in the event of a disaster.

Benefits at a glance

- **Real time data and system replication** – so that in the event of a disaster, data loss is kept to a minimum
- **Secure remote testing** – so your key IT staff do not have to travel to a recovery or alternative location when testing your recovery strategy
- **Highly resilient** – systems are hosted in secure Technology Centres with multiple sources of power and cooling
- **24/7 replication monitoring** – all hosted hardware is monitored and managed centrally via the Sungard AS network operations centre
- **Access to Sungard AS's unrivalled recovery expertise** – for a faster recovery in the event of a disaster
- **Cost-effective** – as it eliminates the need for redundant infrastructure such as a secondary replicated server
- **Storage Area Network (SAN) Efficient** – block level replication identifies changes, rather than copying an entire file, so the system runs at optimum speed with minimal bandwidth
- **Reliable** – as it delivers consistent replication of data across multiple systems
- **Saves time and money** – server recovery in minutes and there is no requirement for duplicate software licences
- **Application independent** – supports all applications running under an operating system, including bespoke solutions
- **Flexible** – asynchronous replication is not distance dependent, giving you the ability to choose your preferred Technology Centre
- **Suitable for organisations with large volumes of data** – as recovery time is unrelated to the volume of storage
- **Transparent** – an online portal allows you to view replication processing
- **Hardware agnostic** – you are not restricted to a specific manufacturer.

Replication, recovery, testing and vaulting

Managed Server Replication & Recovery delivers an RPO (Recovery Point Objective) of near zero and an RTO (Recovery Time Objective) of just 15 minutes per replicated server.

The service works by replicating your systems and data in real time via a dedicated communications link on to hardware and software hosted in one of Sungard AS's highly resilient Technology Centres. This is achieved by installing unobtrusive software on your system so no additional equipment is needed at your premises. This enables information to be electronically transferred to Sungard AS without affecting your system's performance. (The transfer uses just 1 - 3% of your CPU's processing power).

Managed Server Replication & Recovery also provides you with near continuous data protection (CDP) by taking snapshots of your replicated data so that it can be restored in the event of a virus, hardware failure or software corruption. As a managed service, Sungard AS provides the hosted hardware and software at the Sungard AS technology centre: the hosted solution includes the firewall, network switching and internet connectivity required to deliver the solution.

For added peace of mind, Sungard AS monitors the replication system availability 24/7.

Should one or all of your servers fail, the replication service can take over and act as the production server upon invocation of the service.

In short, Sungard AS's Managed Server Replication & Recovery service is designed to dramatically reduce RTO and RPO to help ensure business continuity at a fraction of the cost of traditional replication solutions by either replicating only critical servers or indeed the whole server estate regardless of application, vendor hardware or type of storage attached.
